## Our experience with the device for the treatment of hyperhidrosis

### Electro Antiperspirant

In 2014 the Electro Antiperspirant device was provided for use to the Dermatology Department at Silesian Hospital in Opava. We have mostly applied it for hyperhidrosis of the hands, where effects were seen within 14 days and also on the manifestation of hyperhidrosis in the armpits, where there was a satisfactory effect after 14 days.

On hyperhidrosis of the feet, there was a need for more sessions. The effects of the therapy were evident after 3 weeks to a month. In one patient with marked hyperhidrosis of the feet and verrucose manifestations of lichen and a tendency of maceration of the interdigital, we had to prematurely terminate therapy on account of worsening maceration.

Maintenance therapy is usually required on a monthly basis. We recommend that patients with hyperhidrosis purchase this device precisely for the need of maintenance therapy. We evaluate the therapy as very effective and safe while respecting all contraindications. In our outpatient practice, more frequent use is prevented on account of the time demands. However, we are grateful for the opportunity of using this therapy.
