

Evaluation subject: Medical device Electro Antiperspirant®

We have used the medical device Electro Antiperspirant, manufactured by Hightech Development s.r.o., at the **Dermatological Clinics of St. Anne's and University Hospital in Brno** to treat excessive sweating since May 2013. Given the experience gained, we can state that the device presents a well-proven and very efficient solution to this pathological condition and that thanks to the simplicity of control it can be successfully applied both in clinical conditions and at home.

At the beginning, apply the therapy more frequently, until sweating in the indicated area has completely disappeared. After this period, which lasts about a week, begins the phase of maintaining the desired state. Depending on the type of the patient, the maintaining stage involves two or three consecutive treatments in every few weeks or months as soon as the sweating begins to slowly return. Patients view the treatment positively, and the device causes rapid retreat of problems that come with a diagnosis of excessive sweating, including a significant increase in the quality of life for such individuals.
