Name of the medical device	Electro Antiperspirant ELITE
Class of the medical device	Ia
Used in the Department of Dermatology since	02.02.2019

## Report on the effectiveness of the medical device

The medical device "Electro Antiperspirant ELITE" is used at the Department of Dermatology for Adults of Miedzyleski Specialist Hospital in Warsaw for about 2 years.

During this time, several tens of patients with a diagnosis of excessive sweating of the head, soles of hands and feet have undergone therapy for excessive sweating using the device. After the experience gained, it can be said with certainty that sweating in the mentioned areas subsides after only several applications, according to the treatment plan. For therapies of other parts of the body, it is necessary to ensure a sufficient fit of anatomical adapters. The therapy is well tolerated by the patients, with no side effects. Most patients experienced only minimal tingling during therapy. No redness, burning or stinging reactions were observed after cessation of treatment and application of other topical preparations.

During the application of therapy according to the recommended schedule, a slow reduction of sweating and improvement of quality of life was observed. The condition for such high efficacy was adherence to the treatment schedule by patients - regular use according to schedule brought the best results.

Thanks to the Electro Antiperspirant ELITE device, approximately 50% of patients achieved a cessation of sweating in the treated areas for 3-6 months. Other patients had to undergo maintenance therapies more often, also with good results.

Contraindications of the device are metal orthopedic implants at the location of therapy, pacemaker and cardiac arrhythmia and pregnancy.
